

SWIGGY INSTAMART – REGAIN MARKET POSITION

Capstone Project Final Report

Abstract

This document summarizes all important aspects of the research carried out to analyze Swiggy Instamart's current business situation & states conclusions and recommendations

Abstract

Retail in India has evolved dramatically since 2020 due to the rise of new channel called quick commerce – delivering wide range of products in the matter of few mins. No one could ever imagine the need for instant deliveries of groceries & other essentials is so big that today it is worth USD 3bn in size!! And it is growing at an unbelievable pace, recording a staggering 230% growth between 2021 and 2023.

Investors around the globe are showing great interest in India's quick commerce story with Zepto clocking in USD 1bn in funding in the last one year.

With all the traction in this industry, the competition is also getting intense. A report from HSBC Global Research has found that Blinkit and Zepto are steadily increasing their market share whereas, Instamart is losing the ground. From March 2022 to January 2024, the market leader Blinkit has grown its share to 40% and Zepto's share rose from 15% to 28%. In the same time period, Instamart's market share has fallen from 52% to 32%.

Instamart's 40% decline in the market share is concerning as the competition is getting tougher with more players entering the fray. It is crucial to introspect and carry out a detailed business analysis to identify strategic changes needed to sustain the competition. It needs to act swiftly to regain its market position.

Introduction

Instamart, Swiggy's on-demand grocery delivery service started its operations in selected cities of Bengaluru & Gurgaon in the midst of 2020 pandemic. It offered deliveries in 30-45 mins which created a different category compared to slotted deliveries by existing players like Grofers & BigBasket. The idea clicked with urban consumers and Instamart became the leader in online grocery deliveries.

In the year 2021, however, the rise of ultra-fast delivery model of groceries & essentials further shortened the delivery time to 10 minutes and completely changed the gamut of online deliveries. With their differentiated positioning in the rapidly growing quick commerce industry, Blinkit and Zepto have steadily increased their market share at the cost of Instamart. Based on the consumer behaviour highlighted by survey analytics, users who use quick commerce extensively typically use multiple apps for various reasons & purposes. Although, Instamart has a loyal userbase of old timers, it has failed to attract new customers who are trying new use cases offered by different quick commerce platforms.

The current situation of Instamart thus makes a strong case to address the management decision problem of improving its market share in the quick commerce industry and elevating

consumer perception about the brand by considering differentiated positioning. The research focuses on studying the evolving quick commerce industry in India and assessing why Swiggy Instamart is losing the ground in the category that it pioneered and was leading once. What strategic changes Swiggy should undertake to sustain the fierce competition in this market? The research also includes understanding quick commerce user preferences & their changing behaviour. What growth opportunities in this market are still untapped which can give Instamart a competitive edge.

We have taken a 3-step systematic approach to address Instamart's business problem of decreasing market share. As a first step, we conducted detailed analysis of Swiggy Instamart's business strategies and evaluated their effectiveness as guided by several frameworks. We also deep dived into dynamics of the quick commerce industry to understand industry size, growth potential, strengths & weaknesses of competitors, total addressable market and so on.

Next, to conduct in-depth product analytics, we conducted interviews with q-commerce users to understand their needs, expectations & factors they consider while making buying decision. Based on insights from the discussions, we conducted a survey to get the data on these important factors. We used several analytical methods to deduce actionable insights about Instamart's performance and identify areas of improvement. We also used the survey data to evaluate if it suggests any strategic changes to stay ahead in the competition.

For the strategy execution part, we evaluated the development & execution processes using modern frameworks viz. Design thinking, Lean & Agile. With lots of moving parts & interdependencies between them, execution efficiency plays vital role in business success. Time to market is another important aspect due to intense competition in this industry.

Methodology

In order to address Swiggy Instamart's management problem of declining market share, we used the combination of product strategy analysis, product analytics and agile product management methods as described in detail below.

Product Strategy Analysis

We found the following frameworks relevant to Instamart's business and used them to perform strategic analysis:

Create, Communicate & Deliver Value (Philip Kotler's Concept)

Philip Kotler's concept of value creation stresses on the role of product management in creating value, brand management in communicating the value and co-creation with customers to deliver the value.

Porter's Five Forces Analysis

The Porter's five forces analysis provides in-depth understanding of the industry the company operates in by assessing five important aspects viz. competition, available substitutes, how strong/weak the barriers to entry are and the role of suppliers & customers.

SWOT Analysis

SWOT analysis helps to identify internal and external factors that can have profound impact on the business performance. An organisation's strengths & weaknesses are internal and can be controlled to build a strong competitive moat. On the other hand, opportunities & threats are external which need to be carefully monitored & managed.

Analysis of Core Competencies

This analysis helps to identify core competencies of an organisation that provide sustainable competitive advantage, are applicable in variety of market and difficult to imitate. Company's vision, priorities, culture, core values, technological advancements can be centred around strengthening the core competencies.

Market and Competitor Oriented Strategy

Market orientation focuses on needs & requirements of the consumer whereas competitor orientation closely follows the competition & constantly tries to outperform it. To maintain competitive advantage in the market, it is important to have a mix of market and competitor-oriented strategy.

Brand Positioning

Differentiated brand positioning is important to make your product stand out in a crowded market and make it a superior alternative for potential customers. Building a strong brand helps create brand loyalty, achieve higher price point & gain competitive edge.

Integrated Marketing Communication

The integrated marketing communication strategy puts the emphasis on reaching target customers with relevant & consistent messaging across different communication platforms. The communication needs to be more focused to narrower customer segments.

Product Analytics

The analytics process mainly used qualitative & quantitative methods to define problem statement, formulate research hypotheses, collect & analyse data to test the hypotheses and report conclusive findings.

Qualitative Analytics

To get initial understanding of the problem area, literature review & prior work study was done. Discussions with quick commerce users were also conducted to understand variables and important factors they consider. Based on these insights, the following research hypotheses were formulated:

Research Hypotheses	Instamart, being Swiggy's integrated offering, has lower brand recall in the quick commerce category compared to its competitors
	Average customer satisfaction & product selection of Instamart is lower than that of its competitors
	Lower prices (product, delivery, handling etc.) has significant effect on customer satisfaction of a q-commerce app
	Superior app experience & timely delivery has higher influence on customers willingness to recommend the Instamart app
	Meeting delivery promise significantly improves customer satisfaction of the q-commerce platform
	High quality of fresh produce like fruits, vegetables, meat significantly improves customers perception about reliability of the app

Quantitative Analytics

An online survey was conducted to get the quantitative data for the variables identified in the previous step. The sample size is 116 respondents who use Swiggy Instamart and/or other quick commerce apps and have different demographics. The survey data was coded and transformed in order to perform data analysis.

The types of data analysis used are descriptive & predictive analytics. Descriptive analytics gives high level overview of the data such as consumer perception about different factors, behavioural trends, effect of demographics on consumer decisioning and association between different variables. I have analysed the data to study central tendencies such as mean, median & mode. I have also used correlation analysis to identify dependency between different perception variables.

As a part of predictive analytics, I created simple & multiple regression models to estimate the effect of different strategic actions on consumer decisioning. Also, to predict their future behaviour on the basis of improvement actions that the company can take. Further, I have tested the hypotheses using regression analysis to infer about the population behaviour from our sample statistics.

Agile Product Management

Given quick commerce industry is very competitive and constantly evolving, Instamart should act fast and use combination of all three modern development processes viz. design thinking, lean & agile to deliver its innovative ideas faster.

Design Thinking

Design thinking is a user-centric approach to find solutions & create innovative products. The key stages of this process are - empathise, define, ideate, prototype & test. In the empathise stage, we engage with customers to understand their needs, preferences & pain points. The data thus gathered is synthesised to define the problem statement in more consumer-centric way.

In the ideation stage, the problem is analysed from different aspects and as many ideas as possible are generated. All the ideas thus generated are then screened and scored on features

with maximum value to customer and the organisation. The subset of ideas that we get from this exercise are validated by creating prototypes and getting user feedback to improve the product.

Lean Methodology

The Lean method helps to define value stream & identify key business outcomes to focus on. It regularly checks for customer feedback and is aware of market trends due to which, it prioritises delivering only what adds value at the right time. It follows continuous improvement cycle to deliver more value at lower cost by reducing waste and empowers people & builds trust amongst all stakeholders to make the entire process more efficient.

Agile Frameworks

Agile methodology helps to build better quality products by making incremental progress and incorporating feedback early on. It helps build products iteratively by prioritizing high value deliverables first. Scrum & kanban are common agile frameworks used for execution. Scrum implements fixed interval work cycles called sprints to complete shippable work. Kanban helps to visualize work, limit work in progress items & maximize efficiency by reducing completion time.

Analysis and Result

The following section describes the findings of product strategy analysis, data analytics and product management analysis in detail.

Product Strategy Analysis Findings

Create, Communicate & Deliver Value (Philip Kotler's Concept)

Swiggy Instamart's value proposition is to provide unparalleled convenience & elevate the quality of life for urban consumers. Instamart, with thousands of SKUs spread across categories like grocery, fruits/vegetables & dairy, snacks & drinks, beauty & personal care, household essentials, medicines, stationery, pet care etc. delivers everything you need at your doorstep, just when you need it. It also provides economic value by offering regular discounts, special deals & offers. With strategically located dark stores that are organised for speed & efficiency and advanced algorithms to optimise last mile delivery, Instamart delivers correct orders on time, almost every time!

With more and more players entering into quick commerce business and the competition getting tougher, Instamart should constantly innovate to provide unique & differentiating value proposition to attract new customers and gain more market share.

Porter's Five Forces Analysis

Porter's five forces analysis suggests that the quick commerce is a highly competitive & rapidly growing industry with a constant threat of new entrants. The suppliers & customers have considerable bargaining power which indicates that Instamart should focus more on building strong relationships with manufacturers & farmers to get competitive advantage. It should go aggressive on retaining & acquiring new customers with strong brand positioning and effective sales & marketing strategy.

SWOT Analysis

The SWOT analysis underlines Instamart's strengths in innovation, technology and strong leadership with decade long experience in online consumer business. As a result, it has excellent operational efficiency of its quick delivery model. It also highlights its weakness of inability to maintain the market lead in spite of having the first mover advantage and failure to leverage the platform to build a strong differentiation moat. Instamart has failed to create strong barriers to entry for other players early on by anticipating growth & competition intensity of this market.

On the opportunities front, Instamart's average order value (AOV) is around Rs. 450 which can be increased by promoting more products including the ones with higher margin. The consumer preference survey reveals that there is unmet demand for quality fresh produce, local products & bulk items like flour, rice, which can be targeted.

Analysis of Core Competencies

Technology & innovation has been the cornerstone of Swiggy's business which it perfectly leverages for Instamart as well. The order flow from placement to fulfilment is entirely automated and inventory & warehouse operations are managed in real time. Instamart uses AI to help personalise choices for consumers on the app, decide delivery dispatch algorithm on delivery network, provide high quality search experience using GenAI and much more.

Operational efficiency of dark stores is at the heart of quick commerce model. It includes no. of dark stores, their strategic location and SKUs per store to get maximum benefits. Instamart has around 5000 SKUs per store which is the lowest compared to its competitors. It needs to improve on the product assortments to make the customers spend more on the platform and expand the market by adding more use-cases for people to try out 10-minute deliveries.

Customer and Competitor Oriented Strategy

To maintain a competitive advantage in the market, it is important to have a mix of customer & competitor-oriented strategy. While Instamart's mission revolves around elevating customers' quality of life, mere customer-oriented approach will not help them sustain the fierce competition in this market. It needs to understand the competitors better by knowing their strengths, weaknesses, strategies and anticipating the challenges or threats they may pose to the Instamart business.

Brand Positioning

Instamart is integrated in Swiggy app and it is not positioned as an independent brand for online delivery of groceries and other essentials. Swiggy's integrated super app approach is mainly targeted to leverage the patronage of their existing food delivery customers. However, the current growth of the quick commerce industry has underlined the fact that the penetration of grocery delivery will be larger than the food delivery business.

Swiggy has to thus find and promote a strong differentiating value proposition for Instamart by capturing the untapped opportunities & market segments of the industry. Explore the possibilities of new categories/sub-categories for the offerings that no other competitors have. And then, it should position the Instamart brand such that consumers perceive it as their one-stop go to place for anything they need to buy online.

Integrated Marketing Communication

Once the differentiated positioning is identified, it needs to be communicated to the targeted customers through consistent marketing messaging. Referring the AIDA model, Instamart should promote catchy advertisements in print media, social media, TV & radio commercials to grab attention of the target customers, create interest by highlighting unique value proposition, price discounts, promotional offers etc. Groceries & essentials being repeat purchases, price point plays an important role in creating desire to try out options with lower prices.

Product Analytics Results

Observations from Descriptive Analytics

Average perception about Instamart's product selection, delivery speed, app reliability & user experience is high whereas, the perception about availability of local products, quality of fresh produce & product pricing is low.

On the app usage front, it is observed that 63% of Instamart users use the app either daily or weekly and 53% of them spend less than Rs. 500 on each order. Also, 63% respondents said less than 25% of their monthly shopping is done using the app. In terms of demographics, interestingly, percentage of female respondents is less compared to male (40% v/s 60% respectively) and only 10% homemakers are using the quick commerce platforms.

On analysing the data for time since the users are using these apps, it is observed that Instamart has more users with 2-3 years tenure and very less with less than 1 year. On the other hand, Blinkit and Zepto have considerable number of users who are either using the app for 1-2 years or for less than 1 year. The sample highlights the trend that Blinkit & Zepto have attracted more new customers over the last 2 years.

The comparison between Instamart and its top competitors Blinkit & Zepto on key attributes shows that all of them fare equally on most of the attributes except for fresh products, pricing & delivery speed where Zepto scores slightly higher than the rest two.

It is also observed that quick commerce users typically use two or more apps, contributing to 80% of the total responses. The distribution of this trend over the default app suggests that users who use Blinkit and Zepto as their primary app, tend to be more habitual to quick commerce and explore more. On the other hand, Instamart (and BigBasket) users are more loyal to the platform.

Results of Regression Analysis & Hypotheses Testing

Created simple & multiple regression models & performed t-test for paired means to test the hypotheses and draw conclusion from the findings. Checked the overall significance of the regression model & the coefficient for independent variable(s). If both are significant, i.e. p-value in both the cases is less than 5%, it was concluded that the sample has enough evidence to support the alternate (or research) hypothesis. In this case, the null hypothesis is rejected. If the p-value is not significant ($>5\%$) it was concluded that the sample does not have enough evidence to support the alternate hypothesis, in which case, the null hypotheses is accepted as true.

The regression analysis concludes that Instamart performs fairly well on customer satisfaction & product selection attributes compared to its competitors. It was observed that lower prices & on time delivery significantly improves customer satisfaction of a quick commerce platform. The analysis also concluded that superior app experience & timely delivery have higher influence on customers willingness to recommend Instamart app to friends & family.

Agile Product Management

Design Thinking

In the ideation stage, Instamart product team should brainstorm and generate innovative ideas such as adding feature to collect customer suggestions/feedback about missing products, adding product assortments accordingly, increasing user engagement on the app by showing them relevant products, feature to smartly manage the household inventory by auto-filling the cart or timely suggesting the items to refill based on the usage & buying history.

Instamart should cater to the unmet needs of consumers by regularly engaging with them to find out their concerns regarding quality, availability, size, pricing of products, what features they desire and so on. To build trust with quality of fresh produce, videos of sourcing them with timestamp, location tag can be added on the app. It also needs to come up with more use-cases for different group of users to try out 10-minute deliveries by targeting micro segments of the market.

Lean Methodology

Instamart's strategic and data analysis indicates that operational efficiency is its core strength, that means lean and agile are already integral part of its execution. In quick commerce operations, minimizing time wastage is of paramount importance. In order to achieve this, Instamart optimises each step of the order & inventory management process with the help of robust technology. Reducing waste of products at dark store/warehouse level, resources to run a dark store and overall increasing value to all the stakeholders including customers, merchant partners & delivery partners is important to make this business sustainable & profitable.

Agile Frameworks

Instamart can use either Scrum or Kanban frameworks to make incremental progress on developing new features to attract customers and expand product portfolio based on customer feedback. In design thinking phase, brainstorming, finalising design & creating specification documents should be done iteratively for each problem statement & passed on to development. In development phase, prioritize feature backlog, do effort estimation for user stories and plan sprints to make incremental progress on delivering features. Closely monitor the progress & revisit priorities if needed. Agile also helps to incorporate any new changes as required by rapidly changing market.

Discussion

Instamart is a customer obsessed organisation that lives by the mission of providing unparalleled convenience to its urban consumers. Currently it ranks #2 in the quick commerce market by market share and still holds on to a loyal customer base having patronage since its inception. Innovation, technology & strong leadership have been its pillars of strength which have propelled growth & scalability of its business.

In spite of this it is not being able to attract new customers or make the existing customers spend more on the platform. The strategic analysis reveals that Instamart is integrated in the main Swiggy app and it is not positioned as a separate brand for online delivery of groceries and other essentials. With no differentiated value positioning, it is yet another app delivering groceries & other products online.

The data analysis reveals that lower prices & on time delivery are important factors for customer satisfaction. Also, there are a certain category of products like fresh produce, region specific local products, bulk items like non-branded flour and rice with which the customers are not very satisfied across the platforms. Instamart can take the cues and make any of these as its differentiated value proposition and ensure it is communicated properly to its targeted customers. Swiggy should consider separating out Instamart as a separate brand in the quick commerce category and invest in building the brand with unique value addition.

The strategic analysis suggests a few areas of improvement for Instamart's operational efficiency. Instamart has around 5000 SKUs per store which is the lowest compared to its competitors. Also, its average order value is around Rs. 450. It needs to improve on the product assortments to make the customers spend more on the platform and identify more use-cases for people to try out 10-minute deliveries.

The data analysis highlights important consumer behavioural trends which can be looked at as opportunities for growth & expansion. Over 60% of the respondents do only 25% of their monthly grocery/essentials shopping using the app. Also, half of the respondents spend less than Rs. 500 per order. This suggests that there is a great scope to increase product assortments so that users can do maximum shopping using the app which will eventually also increase their wallet share. Instamart should add features to proactively collect consumer suggestions/feedback and continuously improve its user experience.

The survey data reveals that around 17% of the respondents do not use any of the quick commerce apps. Their demographic data shows they belong to tier 2/3 cities or areas at the outskirts of the metro cities. While the competitors and the new entrants are targeting metro and tier 1 cities, Instamart can explore the market development opportunities in tier 2/3 cities where there is less competition.

Instamart also has opportunity for market penetration by targeting specific group of users in addition to its existing targeted market. The survey data analysis reveals that only 10% homemakers are using the quick commerce platforms. Instamart should think how it can make its offerings more attractive to homemaker women who are the primary decision makers for buying household essentials. It should also look at its pricing strategy around fees & charges and offer discounted or free deliveries initially to attract new customers.

When Instamart was leading the market, it failed to gauge the competition intensity & potential growth of the quick commerce industry, which resulted in lack of strategy to build a

strong competitive moat and create strong barriers to entry for new entrants. In addition to that, with no exclusive brand positioning for its grocery delivery business, Instamart lost the market share to Blinkit & Zepto who exactly did what Instamart chose to ignore.

With quick commerce now on top of everyone's agenda, Instamart should prioritize creating a differentiated brand positioning and improving marketing communication to its targeted customers. It should take competitor-oriented strategy to better understand their strengths, weaknesses, strategies and anticipate the challenges or threats they may pose to the Instamart business. With this focus, it can strengthen its positioning by constant innovation to stay ahead of the curve.

Limitations

The research conducted to analyse Swiggy Instamart's problem of declining market share and derive conclusions based on research findings is solely done for the academic purpose, hence, it comes with the following limitations:

- Scope limitations – The scope of the study is limited to product strategy analysis, data analysis & product development analysis. Any other aspects of comprehensive analysis are out of the scope for this study.
- Limited company analysis – The study lacks in-depth analysis of Swiggy Instamart in terms of understanding end-to-end operational flow, details on its supply chain management, sourcing partners, factors to decide strategic locations of dark stores, technical details including technology stack, ML algorithms/AI models used, financial details including revenue nos., P/L statement etc.
- Limited market research – The study might lack comprehensive market research on competitors & their strategies, deep analysis of market trends and futuristic vision on how the market will evolve
- Regulatory aspects – The study has not covered any regulatory aspects that government or other bodies like distributors federations might impose in order to contain deep discounting on quick commerce platforms and protect interests of local kirana stores
- Sample size limitations – The sample data is collected from a known group of users and it does not guarantee good coverage of user demographics. Given the small size (116), the statistical significance of analytical results presented in this study are subject to reverification using larger sample size
- Subjectivity & bias – The interpretations and conclusions derived from various observations & analysis outcomes may get influenced by the researcher's unintentional bias or subjective opinion

To overcome the limitations, thorough company analysis and comprehensive market research should be done. The sample should be carefully selected and the sufficient data should be ensured. The research should also ensure all the important factors in the context of problem statement are considered.
